

Task

Digital Identity Management is and will be the core of the Internet economy. With the fourth industrial revolution already ongoing: internet banking, mobile banking, eservices and egovernment all on the cards, countries must be ready for the digital economy. This requires countries to embrace and implement digital identity management.

For this lab you are to research Botswana's readiness for digital identity management.

Your report should cover at minimum the following

- What is digital identity management? Why is it important?
- Does Botswana have a digital identity plan in place? What are its implementation timelines? If none exists, argue why it should have one.
- What policies are planned or are in place to support digital identity management?
- Are there digital identity management frameworks proposed? Pick one such framework and analyse how Botswana can implement it – what's on the ground, what is needed, recommendations, etc.

Deliverables

- A 5 page maximum report of your findings.
- Your report should cite **ONLY** journals, conferences, and/or reports of reputable organizations. That is, you are not allowed to use Wikipedia, websites, blogs etc.
